KASKI Sauna panel

The KASKI panel is made from thermally modified wood using heat and steam, without the need for chemicals. This process enhances the wood's resistance to decay and moisture, as well as improving its thermal insulation properties. As a result, KASKI is ideal for various interior applications, including saunas.

The panels feature a concealed fastening system that helps protect the wood from moisture. In wet areas, it is essential to treat the cut edges to prevent cracking. The installation waste is 10-20%.

Thermally modified pine
17x92 mm

Thermally modified spruce
15x174 mm
